Sharaf MR. (2006) Taxonomic and ecological studies on family Formicidae (Order: Hymenoptera) in Egypt including some protectorates with a study of some insect fauna associated with ant species. Ain Shams University, Faculty of Science, Entomology Department, Cairo (unpubl. thesis), 340 pp.

First record of the ant subfamily Aenictinae (Hymenoptera ...

Winged forms have membranous wings. The forewing is larger than the hindwing and the two are hooked together as are all Hymenoptera, hence the name "married wings," but this is very difficult to see. Most ants are workers, and all workers are wingless and female. Some species have workers of different sizes.

Insect Order ID: Hymenoptera (Ants)

Order Hymenoptera: the bees, wasps, hornets and ants. These are four examples of the order Hymenoptera. Clockwise from upper left, the insects are: carpenter bee (genus Xylocopa, family Apidae); wasp; yellowjacket (family Vespidae); honey bee (Apis mellifera). Insects collected and identified by: Sara Mitchell.

Insect Identification - knowyourinsects.org

Hymenoptera is a large order of insects, comprising the sawflies, wasps, bees, and ants. Over 150,000 living species of Hymenoptera have been described, in addition to over 2,000 extinct ones. Females typically have a special ovipositor for inserting eggs into hosts or places that are otherwise inaccessible. The ovipositor is often modified into a stinger. The young develop through holometabolism—that is, they have a worm-like larval stage and an inactive pupal stage before they mature.

Hymenoptera - Wikipedia

Formicidae are our familiar ants. There are approximately 50 British species and 10,000 worldwide. The two common British subfamilies are Myrmicinae and Formicinae. These two subfamilies can be distinguished on close inspection: Myrmicinae have a two-segmented waist, while Formicinae have a single waist segment.
