Definition. The convolution of f and g is written $f * g$, using an asterisk or star. It is defined as the integral of the product of the two functions after one is reversed and shifted. As such, it is a particular kind of integral transform: $(*) \triangleq \int - \infty \infty (-)$.

Mathematical Problems Lecture delivered before the International Congress of Mathematicians at Paris in 1900 By Professor David Hilbert 1. Who of us would not be glad to lift the veil behind which the future lies hidden; to cast a glance at the next advances of our science and at the secrets of its development during future centuries?

Mathematical logic is a subfield of mathematics exploring the applications of formal logic to mathematics. It bears close connections to metamathematics, the foundations of mathematics, and theoretical computer science. The unifying themes in mathematical logic include the study of the expressive power of formal systems and the deductive power of formal proof systems.

A zero vector, denoted $\mathbf{0}$, is a vector of length 0, and thus has all components equal to zero.. Since vectors remain unchanged under translation, it is often convenient to consider the tail as located at the origin when, for example, defining vector addition and scalar multiplication.. A vector may also be defined as a set of numbers $\langle x, y, z \rangle$, ..., that transform according to the rule

FORmula TRANslation.Early high-level computer language designed specifically for writing programs involving mathematical and scientific computations, it provided the basis for BASIC and other languages. Its newer version (Fortran 2000) is an ISO-standard language for advanced applications such as parallel computing. Invented in 1956 by John Backus (born 1924) at IBM.
